

## SEE & TARGET

## LIZZARD operates in the packaging industry

### The problem: Poor visibility in the racking warehouse

Storage and retrieval in racking warehouses requires great care and takes a lot of time: the forks must be exactly aligned with the entry pockets of the pallet. With the naked eye, this is hardly possible above a certain height. If the pallet is picked up incorrectly, serious accidents can occur, resulting in personal injury or high consequential costs.

### The solution: LIZZARD Target!

The forklift fleet of a well-known packaging manufacturer was equipped with the **LIZZARD Target**. The **LIZZARD Target** is a laser aiming device of laser safety class 1M integrated in a solid steel body, which is hooked into the existing fork carrier of the forklift truck. The body also contains the battery unit, which ensures a self-sufficient power supply for the laser, as well as the control unit for the automatic switch-off in idle mode. In operation, the effect is immediately apparent: with the help of the cross laser, the entry pockets of the pallet are precisely targeted to pick up the goods safely. Entry errors and resulting damages are avoided!

**Tip for upgrading:** The **LIZZARD** is also available with a combined laser and camera as **LIZZARD Premium**. The forklift driver can see the position of the forks and the projected laser cross on the pallet on the monitor, even at great heights. This not only makes it easier to pick up loads safely, but it improves the ergonomics for the forklift driver considerably.

**LIZZARD Target:** Laser assistance system for targeting load carriers.

**Mission accomplished - off to the next mission!**
