

SEE & TARGET

LIZZARD operates in the logistics industry

The problem: Narrow entry pockets and poor visibility

A renowned logistics company for sensitive enclosures is faced with the challenge of picking up special pallets with low entry pockets safely and without damage. In addition, the view of the pallet is usually restricted by the lift mast. The enclosures are frequently damaged so that they are unusable and delivery is no longer possible.

The solution: LIZZARD Cam!

The forklift truck was equipped with the **LIZZARD Cam**. The **LIZZARD Cam** is a camera unit integrated in a solid steel body which is hooked into the existing fork carrier of the forklift truck. The body also contains the battery unit, the control unit and the WiFi transmitter for transmitting the image to the monitor in the driver's cab. In operation, the effect is immediately apparent: The camera of the **LIZZARD Cam** is at the same level as the fork blade. With the help of the monitor view in the driver's cab, the narrow entry pockets can be precisely targeted. This means that the goods can be picked up safely - even if the view from the driver's cab is restricted by the lift mast.

Tip: As standard the camera can be installed in two positions to suit the respective requirements.

LIZZARD Cam: Camera assistance system for safe pick-up of load carriers.

Mission accomplished - off to the next mission!
