

Cranked QualityForks

Best visibility and efficient pick-up of load

The characteristic feature of cranked forks is the angled shape of the fork back. This special design allows to expand or reduce the spacing between the forks and provides an unobstructed view of the fork tips at the same time. This results in significant benefits in terms of efficiency and safety.

Cranked forks are available in different dimensions and with various suspensions. The individual design depends on the particular application and will be specified according to your inquiry.

- ▶ Increased safety for individuals and the transported goods
- ▶ Improved forward visibility and unobstructed view of the fork tips
- ▶ Efficient load pick-up
- ▶ Fork blades can be aligned parallel even if there is an obstacle in the middle of the fork carrier (i.e. accessory)
- ▶ Wider pallet pick-up possible when mounting the forks with the fork shank bent outwards

The illustrations only represent the basic principles and do not constitute a contractual entitlement.

Different applications can be realised according to the design and mounting of the forks.
